

Translucent Metallic

Biblio / Onion Skin
These super lightweight papers add an interesting dimension to many projects.

Biblio is 50gsm smooth paper, which despite being exceptionally thin, is also very strong and opaque. As its name suggests, it is the paper that Bibles are commonly made from.

Onion Skin is even lighter than Biblio at only 34gsm. It has an unusual cockle finish that gives a crisp but delicate feel.

Transluents
Our collection of translucent papers is very special.

Transclear is the traditional tracing paper type effect and is used the world over in an endless combination of interesting and innovative ways.

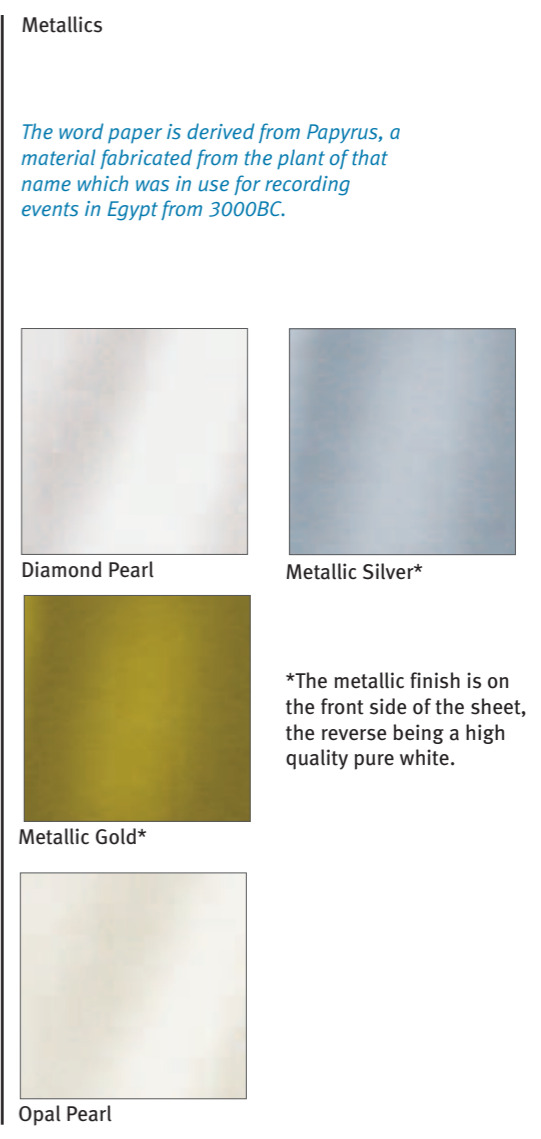

A further option is the much more unique White Cloud and Crystal papers. The same properties as the traditional Transclear but with a subtle effect incorporated into the sheet adding a further dimension.

The final choice is to use colour. From subtle pastel shades to bold and brash colours, they are all available at Paper2go.

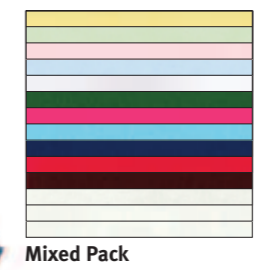

Metallics
We are all drawn to light and reflection – it has a natural attraction.

Paper with a metallic or pearlescent finish has the same effect, it can lift a plain look to something much more enticing. The alluring effect of the Diamond and Opal Pearl colours contrast with the more daring Metallic Silver and Gold.

The word paper is derived from Papyrus, a material fabricated from the plant of that name which was in use for recording events in Egypt from 3000BC.

**The metallic finish is on the front side of the sheet, the reverse being a high quality pure white.*

Tropical rainforests are not used to make paper. In Japan one hardwood tree is used every hundred years to make a special paper for use in Shinto religious ceremonies
